Always Always? Yes, Always

How To Always Build a Fast WordPress Site

All the Steps

- 1. Install NitroPack
- 2. Active and configure NitroPack

Congratulations! You're done 🎉

Your WordPress is now fast

Thank You!

Time for Q&A!

Real Talk

Real Talk

Let's Talk Misconceptions

Caching doesn't make a site fast

- Caching doesn't make a site fast
- A large database won't make a site slow

- Caching doesn't make a site fast
- A large database won't make a site slow
- Memory limit does not affect speed

- Caching doesn't make a site fast
- A large database won't make a site slow
- Memory limit does not affect speed
- A CDN is not all you need

Misconceptions

- Caching doesn't make a site fast
- A large database won't make a site slow
- Memory limit does not affect speed
- A CDN is not all you need

It all starts here

4 Base Principals

- 1. Understand the layers
- 2. Understand your stack
- 3. There's a place and a time for everything
- 4. Work with a Build Foundation

Understand the layers

What's on your server

- Server stack
- PHP
- Application
- Database

Understand the layers

What does your server serve?

- HTML & CSS
- JavaScript
- Assets

Understand your stack

Know Your Stack Inside and out

- Lightweight, baby! Lightweight!!
- Test changes, test often
- Automate all the things

A place and a time

There's a place and a time for everything **Security**

A place and a time

There's a place and a time for everything Security & Caching

A place and a time

There's a place and a time for everything Security & Caching.

They don't belong inside WordPress

There's a place and a time for everything Security & Caching.

They don't belong inside WordPress

Foundation

Develop a Build Foundation before you develop a site.

Get all your best practices in there.

Foundation

These are things like which hosting, which base theme, which plugins (do things fast), optimization, etc.

Testing is developing

Testing, testing, testing.

Will it ever stop? Yo, I don't know!

Testing is developing

This is the bare minimum of what you test:

- 1. Test uncached performance
- 2.
- 3.

Testing is developing

This is the bare minimum of what you test:

- 1. Test uncached performance
- 2. Check what is cached

Testing is developing

This is the bare minimum of what you test:

- 1. Test uncached performance
- 2. Check what is cached
- 3. Test things on mobile

Testing is developing

Test all pages, not just landing pages, but also things like product, checkout and shop pages, forms, etc.

Tips

- Move what you can to the Edge
- Let the server handle your cron
- Add index to metavalue db column

More tips

- Use Redis when it makes sense
- Use Object Cache Pro because it makes sense
- Check out the Performance Labs plugin

Even more tips

- Learn how to Profile plugins
- Check out Perfmatters
- Don't use large plugins for small tasks

I mean, even more tips?

- Use the WP Plugin Manager
- Subscribe to my Within WordPress newsletter
- Block what you can

No more tips

Last tips. I promise

- Look into how Cloudflare can help
- Only apply plugins like NitroPack or WP Rocket as the absolute last step

Are we there yet?

Final Steps

I mean...

The Realest Talk

Final Steps

You have to put in real effort to keep your WordPress site fast. There is not set and forget.

That means automated testing. But also manually testing every single update

Tools to check out

Automate Testing with:

- DeploymentHawk
- User Flow
- Scanfully

Questions?

That's it!

Why did you not mention Core Web Vitals, GT Metrixs and things like that?

Questions?
